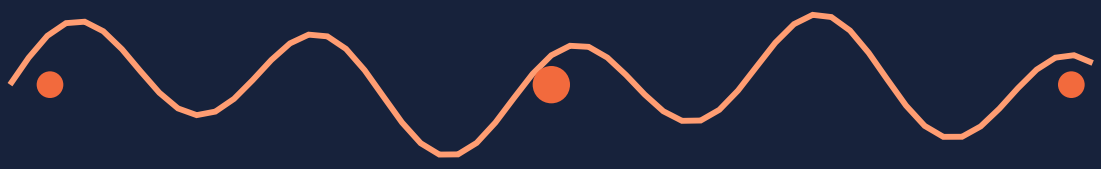
SOUNDHOUND AI / PROJECT KICKOFF

# Conversational AI for cloud telephony

What SoundHound offers today - and a practical path to more capable phone experiences.



**BRIEFING** | Current capabilities + proposed implementation

**FORMAT** | 3-page kickoff

For planning discussion. Product capabilities are summarized from SoundHound public materials; the telephony design on pages 2-3 is a proposal, not a product commitment.

01 / CURRENT OFFERING

# SoundHound brings voice AI and enterprise agents

The portfolio spans voice-first experiences and enterprise customer service. For a telephony program, the strongest fit is the OASYS agent platform and its real-time voice capabilities.

### OASYS agent platform

Build and orchestrate AI agents that can understand requests, use business tools, and complete tasks across customer and employee journeys.

### Enterprise customer service

SoundHound describes a combined conversational AI platform with workflow orchestration, integrations, analytics, and human-assisted understanding for complex service environments.

### Real-time conversational voice

SoundHound describes streaming voice, Speech-to-Meaning, natural interruption (barge-in), and agent reasoning while the conversation continues.

### Industry solutions

Public examples include telecom service, insurance contact centers, healthcare access, restaurant ordering, and automotive voice experiences.

**TELECOM SIGNAL**

SoundHound announced a partnership with Associated Carrier Group in April 2026 to bring agentic AI to telecom customer service and employee experience. The announcement describes coordinated agents for multi-step requests, combining generative AI, deterministic workflows, and human-in-the-loop capabilities.

**SOURCES / PUBLIC SOUNDHOUND MATERIALS**

Agentic voice AI converses at human speed (Dec. 4, 2025) | SoundHound + Associated Carrier Group telecom announcement (Apr. 9, 2026) | Interactions is now part of SoundHound AI (Mar. 5, 2026)

02 / PROPOSED TELEPHONY DESIGN + KICKOFF

# From inbound call to resolved request

Recommendation: pair real-time voice with bounded business actions, existing telephony controls, and a warm handoff. Begin with one high-value call reason.

## REFERENCE ARCHITECTURE

| |
|---|
| **CALL ENTRY** PSTN / SIP trunk / cloud contact center |
| **REAL-TIME VOICE** Streaming speech, interruption handling, language selection |
| **AGENT LAYER** Intent, policy, deterministic steps, specialist agents |
| **APPROVED TOOLS** CRM, billing, service status, scheduling, knowledge APIs |
| **SUPERVISION** Human transfer, context summary, audit, quality analytics |

### FIRST FLOWS TO ASSESS

Service status and outage updates; billing explanations and dispute routing; simple account changes with confirmation.

### NEW TECHNOLOGY TO EVALUATE

Interruptible streaming voice with coordinated task agents, narrow API actions, and human-assisted escalation. Confirm interfaces, availability, and controls in discovery.

## KICKOFF WORKSTREAMS

| | |
|---|---|
| **Journey** Call drivers, IVR and escalation map | **Integration** SIP/contact-center, APIs, test environment |
| **Controls** Identity, confirmations, privacy, retention | **Operations** Human review, analytics, incident fallback |

### PILOT PATH

Baseline > Design + connect > Test + tune > Limited launch

### SUCCESS MEASURES

Resolution and containment; transfer quality; latency and abandonment; answer accuracy and policy compliance

**Leave with:** pilot call type, permitted actions, escalation triggers, owners for telephony/APIs/security/operations, and evidence required before expansion.

Planning recommendation. Telephony connectivity, latency, regions, identity, call recording/retention, licensing, and deployment requirements must be confirmed with SoundHound and the platform owners. Sources are listed on page 2.
