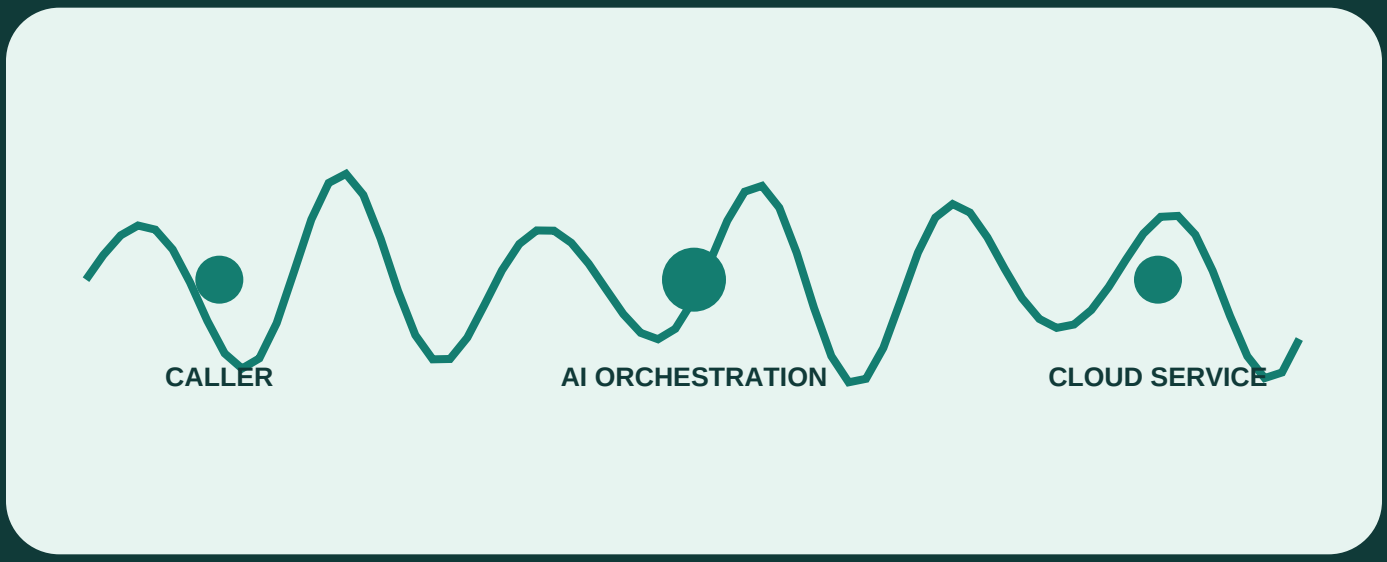
CONVERSATIONAL CLOUD

Sierra Relay

A fictional conversational AI concept for cloud telephony



A calm, context-aware voice layer that helps service teams resolve routine calls while keeping people in control.

FICTIONAL PRODUCT BRIEF • CONCEPT EXERCISE • OCTOBER 2026

Make every call feel like a useful first step

A better front door

A cloud phone number can become a responsive service channel. This concept answers common questions, gathers context, and routes callers with the right details already attached.

Designed around outcomes

Rather than treating every conversation as a script, the assistant listens for the caller’s goal, checks approved business information, and confirms the next action.

A human is always in reach

Callers can ask for a person at any time. The assistant explains when it is automated and avoids pretending to be a human representative.

Design principle

Be useful, be transparent, and make the next step obvious.

A short path from hello to help

01

Identify the need

Open with a clear, friendly greeting. Detect intent from natural speech or keypad input; support interruptions and short answers.

02

Clarify only what matters

Ask one focused follow-up at a time. Repeat critical details such as dates, account references, or callback numbers before acting.

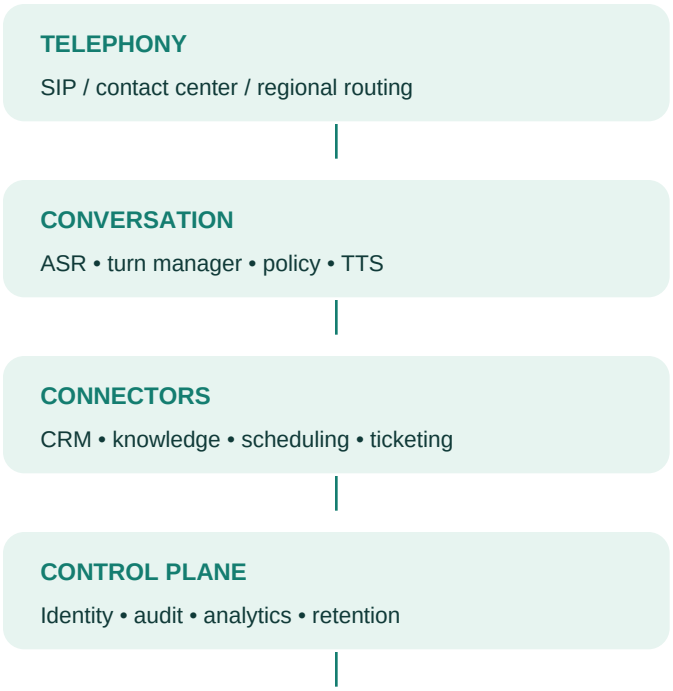
03

Resolve or connect

Complete permitted tasks, share a concise answer, or transfer the caller with a summary and the conversation context.

Experience cues: name automation clearly • support “agent” at any time • confirm consequential changes

A modular path from audio to action



Call ingress

SIP trunk or carrier connection feeds a cloud contact center, with region-aware routing and a graceful fallback destination.

Conversation services

Streaming speech recognition, turn management, policy checks, and speech synthesis operate behind a session orchestrator.

Business systems

A connector layer brokers requests to CRM, scheduling, knowledge, and ticketing APIs. Each action uses scoped credentials and an auditable policy.

Observability

Track latency, transfer rate, task completion, and caller feedback. Store only the minimum audio and transcript data needed under the organization’s retention policy.

Start narrow, learn safely, expand deliberately

Pilot one repeatable call type

Choose a high-volume, low-risk flow such as hours, appointment changes, or order status. Define what counts as successful resolution and when to transfer.

Prepare the service team

Give agents a concise handoff summary, a clear “AI assisted” indicator, and a way to flag incorrect answers for review.

Tune with evidence

Review sampled interactions, monitor failure and abandonment signals, and update approved content before widening the assistant’s scope.

Operational guardrails

Maintain a tested fallback route, version prompts and policies, and include privacy, accessibility, and incident response owners in launch approval.

SAMPLE PILOT MEASURES

Task completion • transfer rate • caller abandonment • answer accuracy • p95 response latency
